

YouTube API Integration Document — tabiji.ai

Prepared by: tabiji.ai
Date: March 9, 2026
API Client: tabiji.ai YouTube Shorts Uploader
Website: <https://tabiji.ai>

1. Overview

tabiji.ai is a free travel itinerary website that generates personalized trip plans for destinations worldwide. As part of our content marketing strategy, we create short-form travel videos (Instagram Reels) and cross-post them to YouTube Shorts to reach a wider audience.

Our YouTube API integration is a **server-side upload tool** that publishes travel videos to **our own YouTube channel**. End users of tabiji.ai never interact with or authenticate through YouTube — the integration is entirely internal.

2. YouTube API Services Used

API Service	Scope	Purpose
YouTube Data API v3	<code>youtube.upload</code>	Upload video files as YouTube Shorts to our channel

This is the only YouTube API scope we use. We do not: - Read or display any YouTube data on our website - Access any user's YouTube account or data - Embed YouTube players or use YouTube's iframe API - Use YouTube Analytics, Reporting, or any other YouTube API service

3. Authentication & Data Flow

Architecture

Authentication Details

- **Auth method:** OAuth 2.0 with offline refresh token
- **Credentials:** A single OAuth 2.0 Desktop App client (`gen-lang-client-0583273035`)
- **Authenticated accounts:** 1 (our own Google account)

- **Token storage:** OAuth refresh token is stored securely in macOS Keychain on our server — never exposed to end users, never stored in code or version control
- **Token scope:** `https://www.googleapis.com/auth/youtube.upload` (upload only)

How It Works

1. A travel video is generated by our content pipeline (AI-generated imagery + text overlays via FFmpeg)
2. Our upload script (`youtube-upload.py`) refreshes an OAuth 2.0 access token using the stored refresh token
3. The script uploads the video file to YouTube via the `videos.insert` endpoint with metadata (title, description, tags, category)
4. The video is published as a YouTube Short on our channel
5. No YouTube data is read back, stored, or displayed anywhere

User-Facing Integration

There is no user-facing YouTube integration. Visitors to tabiji.ai: - Are never asked to sign in with Google - Never see YouTube embeds, players, or data on our site - Have no interaction with YouTube API Services through our platform

4. Data Handling

Question	Answer
Do you store YouTube user data?	No. We do not access any user’s YouTube data.
Do you share data with third parties?	No.
What data do you send to YouTube?	Video files + metadata (title, description, tags) for upload to our own channel only.
Do you display YouTube data on your site?	No.
How is authentication data secured?	OAuth refresh token stored in macOS Keychain (encrypted at rest). Never committed to code, logs, or version control.

5. Technical Implementation

Upload Script

- **Language:** Python 3
- **File:** `youtube-upload.py`
- **Dependencies:** Standard library only (no third-party packages)
- **API endpoint:** `https://www.googleapis.com/upload/youtube/v3/videos` (resumable upload)
- **Video metadata:**
 - `snippet.categoryId` : 19 (Travel & Events)
 - `status.privacyStatus` : public

- `status.selfDeclaredMadeForKids` : false
- `status.madeForKids` : false

Usage

```
# Upload a video as a YouTube Short
python3 youtube-upload.py upload video.mp4 \
  --title "One Thing You Must Do in Tokyo" \
  --description "Travel tip from tabiji.ai" \
  --tags "travel,tokyo,japan"
```

6. Compliance

- We comply with the [YouTube API Services Terms of Service](#)
- We comply with the [Google API Services User Data Policy](#).
- We have a published [Privacy Policy](#) that covers our use of third-party services
- We do not access, use, store, or share any YouTube user data

7. Contact
